PROGRESS

This week we met with Professor Klaesner to go over our plan for the semester, and figure out the biggest challenges we will have while making the device. We have determined that the testing portion of the process will probably be the most difficult because of the necessity of creating protocols from scratch, and making sure our tests themselves are valid. We are working on two separate prototypes to 3D print and need to get them done as soon as possible to begin testing.

QUESTIONS FOR THE GROUP

What hard deadline do we have for 3D printing the first prototype?

When do we want to meet with the client to update him on our progress, and also show him the 3D printed prototype when it's done?
